1. Preamble

This Ballast Water Management Plan (BWMP) has been developed to provide guidance to the Master and the crew of the R/V Armstrong with the procedures to be followed for the operation of the vessel’s ballast water management system. This Plan has been prepared to be practical and easy to use with structured and logical actions required in association with ballast water management operations. This Plan has also been written in the working language of the ship’s crew.

The following items have been included in this Plan:

- Detailed safety procedures for the vessel and the crew associated with ballast water management procedures
- A detailed description of the actions to be taken to implement the ballast water management procedures
- Detailed procedures for the disposal of sediments at sea and to shore
- Procedures for coordinating the discharge of managed ballast water with Port State authorities
- The designation of a Ballast Water Management Officer who is responsible for the implementation of the BWMP
- The reporting and recording requirements provided for in the Ballast Water Management Convention
- Advice regarding the update of the ballast water management step-by-step procedures, sequences for ballast water management, and additional operational and safety restrictions.
- The Bio-Fouling Management Plan

2. Review and Revision History

On a routine basis, the owners/operators and vessel’s crew review the contents of the BWMP. This review is to confirm that the information provided within the Plan is current and contains the information necessary to conduct a ballast water management operation in accordance with the Ballast Water Management Convention and the ABS *Guide for Ballast Water Treatment*. A record of the crew reviews is recorded in the tables in Annex 6 *Ballast Water Training Records*.

-----------------------------	--------------------------

4. Introduction

This Ballast Water Management Plan (BWMP) is written in accordance with the requirements of Regulation B-1 of the International Convention for the Control and Management of Ship's Ballast Water and Sediments, 2004 (the *Convention*), the associated Guidelines and the ABS Guide to Ballast Water Treatment.

The purpose of the BWMP is to meet the requirements for the control and management of ship's ballast water and sediments in accordance with the Guidelines for Ballast Water Management and the Development of Ballast Water Management Plans as contained in MEPC.127 (53) and the ABS Guide to Ballast Water Treatment. The Plan provides standard operational guidance for the planning and management of vessel's ballast water and sediments and describes safe procedures to be followed.

It is the responsibility of the Vessel's Master to review this Plan on a regular basis and confirm that the information contained herein is accurate and current

5. Vessel Particulars:

Vessel Name	R/V Neil Armstrong
Vessel Type	Research Vessel
Port of Registry	Woods Hole, MA
Flag	US
Gross Tonnage (gt)	2,641
Deadweight (DWT)	1,448.72 LT
IMO Number	9688946
International Call Sign	WARL
Length (Overall)	238' 0"
Length (Between Perpendiculars)	230' 0"
Beam	50' 0"
Summer Draft	15' 0"
Deepest Ballast Drafts (normal & heavy weather)	16.25
Total Ballast Capacity - Gallons/ (m ³)	124, 556/ (471.5)
Number of Ballast Tanks	13
Number of Holds	01
Main Ballast Water Management Methods	
Ballast Water Treatment (Priority Preference)	Hyde Guardian/HG60S, treatment by filtration and UV light sterilization

MANAGEMENT SYSTEM MANUAL

Gary McGrath	Al Suchy

Ballast Water Exchange (Secondary Preference)	<ol style="list-style-type: none"> 1. Sequential 2. Flow Through 3. Dilution
Classification Society and ID	ABS YY242066
Identification (Rank) of the Appointed Ballast Water Management Officer	2 nd Mate

6. Ballast Water System

6.1 Description

The ballast system on the Armstrong is composed of thirteen (13) segregated ballast tanks. The ballast pump is a self-priming, centrifugal, Ampco Z Series 3 x 2 -10, rated at 360 gpm at 230' TDH, and 3,450 rpm. A 40 HP motor drives the pump. The ballast pump motor is powered from the switchboard (P 432). The pump and motor operated valves are remotely controlled from the Pilothouse using the Siemens IAS400 panel. The Pilothouse has master control of the pump and valves. Transfer of control to the Main Control Console (MCC) is required in order to operate from the engine room. Local control is available in the engine room.

Ballast Water Treatment System (BWTS)

A BWTS is installed onboard this vessel for the treatment of ballast water, some general information of the system is given below:

- Hyde Guardian[®] HG60
- Treatment by filtration and UV light - The unit consists of 8 parallel stacked housings with 55 micron disk filters and a UV sterilizer.
- Treatment Rated Capacity (TRC) – (60 m³/hour)
- 480 VAC/ 3 Ph/ 60 Hz

6.2 Plans/Drawings of the Ballast System

Plans, drawings and/or documents of the ballast system have been provided and are appended accordingly to this Plan. The number of plans, drawings or documents provided has been limited to those determined to be necessary and has been reviewed and revised as necessary by the vessel's crew in order to avoid the inclusion of extraneous materials. Refer to Annex 1 *Ballast Water System Drawings and Data* & Annex 2 *Ballast Water Management System Installed on Board* for ship specific information.

The following additional plans or drawings and ship specific documents can be found in the ships library or the on-line library drive Z: under *SWBS No. 529 Bilge Ballast and Oily Waste Systems*.

- Hyde Guardian BWTS HG60 System Flow Schematic Drawing G500148, Rev O (*Includes sampling point*)
- Tank Sounding Tables, Drawing 65411-806-02, Rev A
- Vents, Fills and Soundings, Drawing 65411-506-01, Rev C

7 Ballast Water Sampling Points

7.1 General

Article 9 of the *Ballast Water Management Convention* provides for compliance monitoring by officers duly authorized by a Party to the *Convention* for the purpose of monitoring regulatory compliance. The availability and suitability of ballast water sampling points is an essential component of ballast water management. These sampling points have been provided so as to enable the officers or other interested parties to take samples of ballast water for confirming compliance of regulations or monitoring the required effects of ballast water management.

Sampling requirements for compliance control of Regulations D-1 and D-2 of the *Convention* differ as the two regulations have significantly different parameters.

Sampling of ballast water is primarily a function of the authorized authorities, and it is unlikely that a crew member will be required to take samples unless at the expressed request and under the direct supervision of an authorized Port State inspection officer.

The vessel's Master and crew specifically advise authorized officers of the safety procedures and the precautions to be observed when entering enclosed spaces.

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator:	Approved By:
Gary McGrath	Al Suchy

The Master will contact the appropriate Port State authorities to obtain as much notice as possible regarding the intention of the authorized officers to take samples in order to assist in the planning and to provide for the required resources. The Master will provide all reasonable assistance to the authorized officers in support of the function of sampling.

Additional guidance on ballast water sampling can be found in the Annexes to *IMO Resolution MEPC.173 (58)* "*Guidelines for Ballast Water Sampling (G2)*".

7.2 Sampling for Compliance with the Exchange Standard (Regulation D-1)

The sampling and analysis methods to test for compliance with D-1 standards may be found in BWM.2/Circ.42 "*Guidance on ballast water sampling and analysis for trial use in accordance with the BWM Convention and Guidelines (G2)*".

For this vessel, the access and sampling point arrangement to ballast tanks is given in the following plans:

- Hyde Guardian BWTS HG60 System Flow Schematic Drawing G500148 Rev O (*Includes sampling point*)
- Vents, Fills and Soundings, Drawing 65411-506-01, Rev C (*when sampling through individual tank sounding tubes if required*)

7.3 Sampling for Compliance with the Performance Standard (Regulation D-2)

Sampling for compliance with the D-2 Performance Standard should be taken from the discharge line as near to the point of discharge as practicable during ballast water discharge whenever possible. Sampling via manholes, sounding pipes or air pipes is not the preferred approach.

The sampling and analysis methods to test for compliance with D-2 standards may be found in BWM.2/Circ.42 "*Guidance on ballast water sampling and analysis for trial use in accordance with the BWM Convention and Guidelines (G2)*".

The location of the sampling and access point for the ballast water tanks can be found in Hyde Guardian[®] HG60 System Flow Schematic G500148 and is provided in Annex 1 of this Plan.

8 Operational Information on Ballast Water Management

8.1 General

Ballast Water Management (BWM) means mechanical, physical, chemical and biological processes either singularly or in combination to remove, render harmless, or avoid the uptake or discharge of harmful aquatic organisms and pathogens within ballast water and sediments. Currently, two general practices are recognized by the *Convention*, namely the ballast water exchange for compliance with Regulation B-4 in accordance with Regulation D-1 and the use of ballast water management systems (BWMS) for compliance with Regulation B-3 in accordance with Regulation D-2.

Discharge of ship's ballast to a ballast water reception facility provided by a Port State in accordance with Regulation B-3.6 is also an acceptable ballast water management practice, although there are limited approved ballast water facilities. The *IMO Resolution MEPC.153 (55) Guidelines for ballast water reception facilities (G5)* provides requirements for ballast water reception facilities.

8.2 Ballast Water Treatment

Ballast Water Management System (BWMS) means any system which processes ballast water such that it meets or exceeds the ballast water performance standard in Regulation D-2 of the *Ballast Water Management Convention*. The

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator:	Approved By:
Gary McGrath	Al Suchy

BWMS includes ballast water treatment equipment, all associated control equipment, monitoring equipment and sampling facilities.

Hyde Guardian[®] HG60 System is equipped with a 55 micron filter bank and UV sterilizer, which in combination, will remove and render harmless, discharge of harmful aquatic organisms and pathogens within ballast water and sediments. The BWMS installed has been type approved in accordance with Regulation D-3 of the *Convention* and should only be operated in accordance with the system design criteria and the manufacturer's operational and maintenance instructions.

The use of this treatment system is detailed in this document. All failures and malfunctions of the system are recorded in the *Ballast Water Record Book*. A record shall also be made in NS5 including all maintenance and repairs performed. Entries of treatment of the vessel's ballast water are made on the *Ballast Water Reporting Form*. Examples of these forms are provided in Annex 4 section 4.b of a *Ballast Water Reporting Form* and in 4.d *Narrative Record of Unusual Events*, this form is required for providing details of the specifics of failures and or malfunctions of the BWTS.

8.3 Ballast Water Exchange

Ballast water exchange can be used for this vessel to meet the performance standard described in Regulation D-1. The exchange practice will only be used when the BWTS is not available or if time is of the essence for safety of the ship.

There are three (3) methods of ballast water exchange recognized by IMO. These are the sequential method, flow-through method and the dilution method. Both of the latter methods are considered as "pump-through" methods. Each of these has particular safety aspects associated with it, which require special considerations when selecting the appropriate method(s) to be used on this vessel. The degree to which a vessel is suited to the sequential method, the flow-through method or the dilution method depends on its design and age.

Regulation B-4 of the *Convention* requires that vessels should conduct ballast water exchange:

- At least 200 nautical miles from the nearest land and in water at least 200 meters in depth; if not possible
- At least 50 nautical miles from the nearest land and in water at least 2000 meters in depth; or
- In sea areas designated by the port State.

All local and/or national regulations will be taken into consideration as they may specify other criteria for water depths and distances from land.

This vessel shall not be required to deviate from its intended voyage or delay the voyage in order to comply with any particular requirements as indicated above. The voyage should be planned taking into account when ballast water exchange in accordance with the above criteria can be carried out.

Because of the possibility that partial exchange may encourage re-growth of organisms, ballast water exchange will only be commenced in any tank if there is sufficient time to complete the exchange to comply with the standard in Regulation D-1 and the ship can comply with the distance from land and minimum water depth criteria in Regulation B-4. As many complete tanks should be exchanged to the standard in Regulation D-1 as the time available allows. If for any tank the standard in Regulation D-1 cannot fully meet the exchange standard, the exchange should not be commenced for that tank.

In cases where the vessel's Master decides that a ballast exchange would threaten the safety or stability of the ship, its crew or its passenger because of adverse weather, ship design or stress, equipment failure or any other extraordinary condition, the vessel will not be required to comply with the above requirements.

When a vessel is required to conduct ballast water exchange but does not do so in accordance with the regulation, the reasons shall be entered in the vessel's Ballast Water Record Book.

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator:

Gary McGrath

Approved By:

Al Suchy

8.3.1 Sequential Method

The sequential method is also known as the “empty-refill exchange” method and entails first pumping out the tank containing coastal water until it is empty, or nearly so, and then refilling the tank with open ocean water to achieve a 95% volumetric exchange. All the ballast water in each tank should be discharged until the pump loses suction to avoid a possible situation where organisms are left in the bottom of the tank and the tank is refilled with new water which may allow re-emergence of organisms.

The sequential method entails emptying ballast tanks of coastal water and refilling with open ocean water. Emptying of certain tanks may lead to significantly reduced stability, higher vessel structural stresses, high sloshing pressures and/or reduced forward drafts which may then increase probability of bow slamming.

Margins have been provided for stability and strength for all seagoing conditions, as specified in the vessel’s approved trim and stability booklet and loading manual. The loading conditions for the selected ballast water exchange method will be taken from the approved loading manual and trim and stability booklet. The following items will be evaluated to mitigate the risks to the vessel when the sequential method is selected for ballast water exchange:

- Intact stability
- Longitudinal strength
- Sloshing
- Forward and aft drafts
- Bottom forward slamming and associated hull vibration
- Propeller immersion
- Over- and under-pressurization of tanks and holds
- Free surface effects
- Bridge visibility

In planning the sequential exchange sequence, the following considerations will be followed:

- The exchange sequence is to be divided into steps
- Each step represents emptying or filling one tank or a pair of tanks and is evaluated as a loading condition by the loading computer to verify conformity with the vessel’s operating limits
- The printout results of the loading computer includes a summary ballast water exchange sequence table showing the degree of fill for each tank and the values calculated for various criteria parameters (e.g. estimated drafts, trim, BM, SF propeller immersion, etc.)

8.3.2 Flow-through Method

The flow-through method is accomplished by pumping open ocean water into a full ballast tank and allowing water to overflow the tank from the top or from other overflow arrangements for a length of time that will change the ballast water tank volume three times. Ballast water equal to approximately three times the tank capacity must be pumped through the tank to achieve 95% effectiveness in eliminating aquatic organisms.

The flow-through method does not typically alter stability, hull girder stress and vessel attitude. It therefore eliminates the concerns of exceeding bending moment and shear force limits and concerns related to shallow forward and aft drafts and extreme trims. In those instances where the flow-through method alters stability, hull girder stress or vessel attitude, a ballast water summary sequence table is to be submitted demonstrating that strength and stability have been maintained.

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator:

Gary McGrath

Approved By:

Al Suchy

As the flow-through method is not necessarily suitable for all tanks, the following safety issues are evaluated when the flow-through method is selected for ballast water exchange:

- Safe pumping procedures taking into account additional vessel structural stress that may be involved with conducting ballast water exchange
- Over-pressurization of ballast tank or pumping equipment
- Avoid a flow-through that has ballast flowing on decks which can cause a safety hazard to crew
- Inlet and outlet piping connections be located as remotely from each other as practicable.

8.3.3 Dilution Method

The dilution method is similar to the flow-through method but open ocean water is filled through the top of a full ballast tank with simultaneous discharge from the tank bottom at the same flow rate, whereby maintaining a constant level in the tank throughout the ballast exchange operation. As with the flow-through method, ballast water equal to approximately three times the tank capacity must be pumped through the tank to achieve 95% effectiveness in eliminating aquatic organisms.

The dilution method has the advantages of the flow-through method with regard to maintaining the stability, strength and other similar benefits. By discharging water from the bottom of the ballast tanks, sediments are more easily removed. This method avoids the use of air vent and the removal of manhole covers to discharge water over the deck.

The following safety precautions are to be taken when this method is selected for ballast water exchange:

- Arrangements are to be made to automatically maintain the ballast water level in the tanks at a constant level
- High and low water level alarms are to be provided where maintaining a constant level in a tank or hold which is essential to the operational efficiency of the vessel during ballast water exchange
- Over- and under-pressurization because of rapid change in volume of contents of the tank
- Arrangements are to include the provision of a manual emergency stop for any operating ballast pump in case of valve malfunction or incorrect control actions.

8.3.4 Evaluation of Exchange Sequences

For each of the ballast exchange methods determined to be suitable for the vessel, the vessel's loading condition and exchange sequences for the selected methods are to be verified by calculations to show compliance with the applicable requirements for ballast capacity, trim, stability, longitudinal strength and local strength. These approved conditions are included in the vessel's loading manual and/or the trim and stability booklet. The vessel operators use these approved ballast water exchange loading conditions when performing ballast water exchange operations.

8.4 Precautionary Practices

8.4.1 Minimizing Uptake of Harmful Aquatic Organisms, Pathogens and Sediments

When loading ballast, every effort should be made to avoid the uptake of potentially harmful aquatic organisms, pathogens and sediments that may contain such organisms. The uptake of ballast water will be minimized or where practicable, avoided in areas and situations such as:

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator: Gary McGrath	Approved By: Al Suchy
-----------------------------	--------------------------

- Areas identified by the port States;
- In darkness when organisms may rise up the water column;
- In very shallow water;
- In the vicinity of sewage outfalls;
- Where there is a known outbreak of diseases communicable through ballast water;
- Where the incoming and outgoing tide is known to be more turbid;
- Where the propeller may stir up sediment; or
- Where dredging is occurring or has recently occurred.

8.4.2 Avoiding Unnecessary Discharge of Ballast Water

Where it is necessary to take on and discharge ballast water in the same port to facilitate safe cargo operations, care should be taken to avoid the unnecessary discharge of ballast water that has been taken on in another port.

An annotation is to be provided explaining that any exchanged ballast water which is mixed in a ballast tank with non-exchanged water is no longer considered to be properly exchanged.

9 Safety Procedures for the Vessel and Crew

9.1 General - This section of the BWMP contains the specific safety aspects of the BWMS and/or the ballast water exchange system(s) used onboard the vessel.

9.1.1 Ballast Water Treatment Safety Precautions

In case of any failure compromising the proper operation of the BWMS, audible and visual alarm signals are given at the local control station from which the ballast water operations are controlled and the IAS400 Monitoring system panels located in the MCS, Bridge, chief engineer's & Master's staterooms.

A safety assessment methodology is provided in the IMO Circular, BWM.2/Circ.20 entitled "*Guidance to ensure safe handling and storage of chemical and preparations used to treat ballast water and the development of safety procedures for risks to the ship and crew resulting from the treatment process*". The safety assessment has been undertaken by the Owner/vessel's Master in conjunction with the manufacturer of the BWMS and the supplier of the active substance or preparation, taking into consideration the specific design of the vessel, the design of the BWMS and the specific properties and risk of any chemical or preparation either used for the treatment or generated during the treatment process.

Reference has been made to the operating and maintenance manuals of the manufacturer regarding the safety aspects and precautions of the installed ballast water management system.

Reference is made to information regarding the safety aspects of the onboard system before carrying out any operations.

When referring to "Lamps" in the sections listed below these are the UV Lamps used in the disinfection of ballast water.

9.2 Ballast Water Treatment

9.2.1 Electrical Hazards

Electrical hazards are present which may cause personal injury or damage to equipment. Maintenance and repair should only be performed by qualified individuals. Follow all log-out/ tag-out procedures as specified in *SMS 7.8.2 Lockout/ Tag-out* procedures when isolating power. Caution: this system uses multiple sources of power.

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator:

Gary McGrath

Approved By:

Al Suchy

9.2.2 Ultraviolet (UV) Light Exposure

This equipment employs powerful sources of ultraviolet radiation in the UV-A, UV-B and UV-C region of the electromagnetic spectrum. Exposure of the eyes or skin to ultraviolet radiation may cause severe damage. Follow all precautions and wear required protective gear including, long-sleeved shirts, gloves and appropriate safety glasses. Do not look directly into a UV lamp that is switched on.

The UV chamber is designed to minimize any exposure to ultraviolet radiation however certain operations will require personal protection.

9.2.3 Mercury within UV Lamps (See MSDS in section 1.7 of reference (e))

Mercury is contained within the UV lamps. If the lamps are broken, there is risk of exposure to mercury liquid or vapor. Carefully remove the mercury after collecting by binding it with sulfur powder. It is recommended that a mercury spill kit and appropriate personal safety equipment be available in the event of a spill. Recovered material is to be taken to a depot for chemical waste in accordance with local regulations.

The greatest probability of a mercury spill will occur during the handling and storage of UV Lamps. Lamps are to be stored in a manner which will prevent them from breaking and use extreme care when handling lamps. If one of the quartz sleeves breaks, shut off the liquid supply pipes immediately and turn the system off. Replace the defective parts and only power the system on again when all respective internal safety procedures have been completed.

If mercury has been released to the air, appropriate safety measures must be taken such as the use of an air purifying respirator (APR) or full evacuation of area until remedial action has been completed.

Lamps must be recycled using an approved recycling facility or disposed of as hazardous waste.

Some local governments have specific regulations applicable to the storage and disposal of lamps containing mercury. Adhere to the specific regulations where applicable.

9.2.5 Contents under Pressure

Release system pressure before servicing. Maintenance and repair should only be performed by qualified and trained engineers or by direction. Lockout, tag-out procedures shall be used as found in *SMS 7.8.2 Lockout/ Tag-out* when isolating valves in a system.

9.2.6 Hot Surfaces

Certain areas of the chamber may contain hot surfaces. Remember UV-Lamps remain hot for a considerable time after they have been turned off. Allow the lamps to cool off after use for at least 30 minutes.

9.3 Ballast Water Exchange at Sea

9.3.1 General

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator:

Gary McGrath

Approved By:

Al Suchy

The exchange of ballast water at sea has the potential to be more hazardous than ballast water operations conducted in port. Taking into consideration that adverse weather and sea conditions can be encountered in a short time while underway in an open sea, ballast water exchanges at sea are pre-planned well in advance. Safety procedures aimed at addressing the potential for increases in hull stresses, loss of transverse stability, bottom slamming, adverse effects on the vessel's maneuverability, over- and under-pressurization of ballast tanks, and the effects of sloshing loads on tanks represent only a few of those issues that warrant a heightened awareness from the crew and are included in this section of the BWMP.

Precautions including keeping the hull girder stresses and bending moments within the permissible limits contained therein in the approved loading manual and confirming that the vessel maintains adequate intact stability, as contained in the approved trim and stability booklet, are adhered to throughout the exchange sequence.

Continual monitoring of the ballast water exchange operations is required. The monitoring includes the pumps, levels in tanks, the line and pump pressures, stability and hull girder stresses of the vessel.

Detailed instructions and procedures for crew safety, including but not limited to, proper lighting being provided when the crew is working on deck, procedures for opening sampling points and guidance regarding water on deck (where the flow-through method is used) are addressed.

9.3.2 Safety Considerations

The following general safety considerations are evaluated for each step of the full exchange sequence in the ballast water exchange:

- i) Maintenance of adequate intact stability in accordance with an approved trim and stability booklet, taking into account the free surface effects of partially filled ballast tanks;
- ii) Operation within acceptable ranges of the forward and aft drafts and trim with particular reference to bridge visibility, propeller immersions and slamming;
- iii) Maintaining hull girder loads below the permissible seagoing strength limits of shear forces, bending moments and torsional moments in accordance with an approved loading manual;
- iv) Risk of over-and under-pressurization of ballast tanks due to ballast pump capacity and vent size/location;
- v) Need for greater margins on stability, strength and drafts in severe weather conditions;
- vi) Weather routing in areas seasonally affected by cyclones, typhoons, hurricanes or heavy icing conditions;
- vii) Likelihood of sloshing loads in ballast tanks that may be slack at any one time
- viii) Safety precautions to be taken when personnel are required to work on deck at night, in heavy weather, when ballast water overflows the deck and in freezing conditions.
- ix) Contingency procedures for situations which may affect the ballast water exchange operation including deteriorating weather conditions, pump failure and loss of power

9.3.3 Safety Considerations pertaining to the Specific Ballast Water Exchange Method(s) Selected:

Sequential Method

- Maintaining adequate intact stability
- Means to prevent the longitudinal hull girder stress and, where applicable, torsional hull girder stress level exceeding the permitted values with regard to the prevailing sea conditions

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator:

Gary McGrath

Approved By:

Al Suchy

- Measures taken to prevent significant structural loads resulting from sloshing action of partially filled tanks, especially where the partially filled tanks are adjacent to empty tanks
- Maintaining forward and aft drafts and trim to provide for adequate bridge visibility, propeller immersion and minimum forward draft

Flow-Through Method

- Verifying air vent pipes are properly sized and open for continuous overflow
- Avoiding the risk of over-pressurization of ballast tanks and ballast piping
- Avoiding flowing and accumulation of water on the deck

Dilution Method

- Means to automatically maintain the ballast water level in the tanks at a constant level
- Provision of high and low water level alarms in ballast tanks
- Avoiding over- or under-pressurization of ballast water tanks and ballast piping

9.3.4 Precautionary Advice for Planning of Ballast Water Exchange Operation

During ballast water exchanges there may be times when, for a transitory period, one or more of the following criteria cannot be fully met or are found to be difficult to maintain:

- Bridge visibility standard (*SOLAS V/22*);
- Propeller immersion; and
- Minimum draft forward.

In planning a ballast water exchange operation that includes sequences which involve periods when the criteria for propeller immersion, minimum draft and/or trim, and bridge visibility cannot be met, the vessel's Master will assess:

- The duration(s) and time(s) during the operation that any of the criteria will not be met;
- The effects(s) on the navigation and maneuvering capabilities of the vessel; and
- The time to complete the operation.

A decision to proceed with the operation should only be taken when it is anticipated that:

- The ship will be in open water;
- The traffic density will be low;
- An enhanced navigational watch will be maintained including, if necessary, an additional lookout forward with adequate communications with the navigation bridge;
- The maneuverability of the vessel will not be unduly impaired by the draft and trim and/or propeller immersion during the transitory period; and
- The general weather and sea state conditions will be suitable and unlikely to deteriorate.

9.3.5 Conditions in Which Ballast Water Exchange at Sea should not be undertaken

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator: Gary McGrath	Approved By: Al Suchy
-----------------------------	--------------------------

The BWMP includes a list below of circumstances in which ballast water exchange should not be undertaken. These circumstances may result from critical situations of an exceptional nature, force majeure due to stress of weather, known equipment failures or defects, or any other circumstances in which human life or safety of the vessel is threatened.

- Ballast water exchange at sea will be avoided in freezing weather conditions. However, when it is deemed absolutely necessary, particular attention will be paid to the hazards associated with the freezing of overboard discharge arrangements, air pipes, ballast system valves together with their means of control, and the accretion of ice on deck.
- Exchange at sea will be avoided when routing in areas seasonally affected by cyclones, typhoons and hurricanes, as well as in areas where short range visibility is crucial for navigation.
- During scientific operations unless directed by the Master.

9.4. Procedures for Safe Tank Entry

Follow all precautions as defined in the SMS 7.8.1 *Confined Space Entry*.

10 Operational and Safety Restrictions

Details of specific operational and safety restrictions including those associated with the BWMS which affects the ship and/or the crew including reference to procedures for safe tank entry has been considered.

10.1 General

The implementation of the BWMP is largely dependent on the proper planning and execution of the task contained therein. Thus, pre-planning and training are essential to provide an effective management practice of the vessel's ballast. The detailed safety issues and procedures discussed in Sections 9 and 10 shall be adopted during the development of the ship's voyage plan.

10.2 Ballast Water Treatment System (BWTS)

Operational manuals of the ballast water treatment system (ref e.) have been provided on board the vessel with key procedures included in the vessel's BWMP.

10.3 Exchange at Sea

A ballast handling plan for each voyage will be prepared well in advance, taking into account the safety considerations discussed in Section 10. This section gives guidance on additional operational and safety handling procedures to be followed at sea.

Ballast exchange procedures, regardless of the method selected, are complex and may require a prolonged period, sometimes lasting days, to complete. Detailed training for all crew members that may participate in the exchange of ballast water are conducted so that the crew can safely perform the routine duties that are expected of them and respond to an emergency should it occur.

Operational limits defined for specific ballast exchange conditions will be adhered to during ballast operations.

When conducting ballast water exchange, the vessel's Master, Ballast Water Management Officer and crew will maintain a diligent watch in order to respond to power failures, ballast pump or pipe failures or structural

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator: Gary McGrath	Approved By: Al Suchy
-----------------------------	--------------------------

failures. Should any of these events occur, they will be reported immediately to the company's safety office in accordance with established procedures.

Some shipping lanes may not comply with the requirements concerning the minimum distance and water depth that are required by the *Convention*. The vessel in such regions will use a rule-based risk assessment, making use of the exemptions or designated ballast water exchange zone in the region.

11 Method(s) Used on board for Ballast Water Management and Sediment Control

11.1 General

This section of the BWMP identifies the specific method or methods of ballast water management utilized onboard the vessel. Details of the method(s) including the step-by-step procedures of operation of the management practices are provided.

A ballast handling plan for a voyage will be planned in advance, in a similar manner to the preparation of a cargo plan, with the same degree of thoroughness. The pre-planning is necessary in order to maintain safety in case of compliance with the ballast water exchange, ballast treatment or other BWM options. The safety information and operation/safety restrictions are taken into account when preparing the ballast handling plan.

11.2 Procedures for Ballast Water Treatment

The Hyde Guardian® Ballast Water Treatment System installed onboard R/V Neil Armstrong is used as the vessel's primary ballast water management practice in the normal operation of the vessel. The treatment process is a two-stage process: during ballasting, water is processed first by filtration to remove any particles of larger than 50 microns in size it then passes through the UV treatment to disinfect the organisms then to the vessel's ballast tanks. When discharging ballast water, the system will again pass the ballast water through the UV chamber to disinfect prior to going overboard. Filtration is not required in this stage of the process.

11.2.1 Particulars and Specification of the Treatment System

- Model: Guardian®/HG60S, Manufacturer: Hyde Marine
- Process: Treatment by mechanical filtration and UV light sterilization (biological disinfection)
- The Guardian Filter System (GFS) is made up of modules containing "stacked disk" filter elements that capture and store solids. The filter is designed to automatically backwash at the end of each ballasting operation and, when necessary, cleans one module at a time using filtered water from the remaining modules. This allows for immediate discharge of filtered material back to the ballast water source.

11.2.2 Operation of the Ballast Water Management System - The two primary operations of the system are:

1. Ballasting - The flow path and valve line up during ballasting procedure is as follows:

IAS-400 # Designation	BWTS Valve #	Valve # Designation	Description	Position	Type Valve
n/a	n/a	529-VL-001	Valve at Sea Chest	Open	5" Gate, Manual
529-02-03	n/a	529-VL-002	Ballast Pump Overboard Suction	Open	5" Motor Controlled
529-02-04	n/a	529-VL-003	Ballast Suction (to manifolds fwd. & Aft)	Closed	5" Motor Controlled
529-02-01 Ballast Pump Suction

¹ See 'Table No. 2 Ballast Manifold Valve Arrangement'

² Automatically controlled by BWMS.

³ There is no need for water to be directed through the filter system during de-ballasting.

Additionally, there are two secondary operations:

- 1.) Filter Backwashing
- 2.) Stripping

Secondary Flow Paths –

Filter Backwashing

Filter elements over time will start to clog with sediment and larger organisms causing differential pressure across the filter to increase. The BWTS will continuously monitor the differential pressure across the filters. When the differential pressure reaches a set point automatic backwashing will occur. Backwash water is discharged overboard.

Ballast Tank Stripping

No permanent ballast water stripping pumps are installed on the R/V Neil Armstrong. If stripping is required caution should be used as the UV chamber must be installed vertically to insure that air does

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator:

Gary McGrath

Approved By:

Al Suchy

not build up in the chamber and cause damage. Positive displacement pumps should be used when stripping tanks.

11.2.3 Control and Monitoring Equipment

The control equipment has the capability of automatically monitoring and adjusting necessary treatment aspects of the BWMS of the vessel. The equipment also incorporates a continuous self-monitoring function during the period in which the BWMS is in operation. The control aspects of the system are as follows:

UV Power Level Control – there are 2 power levels. The system starts running at power level 1. The system is designed to deliver satisfactory UV dose down to 70%. If the level falls below 70% the following actions are taken:

- A wipe cycle is performed to clean the quartz sleeves and UV Sensor
- If the relative intensity remains below 70% the lamps are switched to power level 2
- If the relative intensity still remains below 70%, a low UV alarm is set
- The UV system will remain at power level 2 (highest) until the system is stopped and reset

Backwash Cycle

Data Logging - The Guardian Control System (GCS) continuously logs the status of the treatment system. This log is kept on the PLC's memory cartridge. monitoring equipment records the proper functioning or failure of the BWMS and the control equipment will be able to store data for at least 24 months, and will display and print a record for official inspections as required. In the event of the control equipment being replaced, means are provided so that the data recorded prior to the replacement remains available on board for 24 months.

- Guardian S7-200 Control System and Explorer Data Log – Detailed instructions for using the LCD based Operator Interface Terminal (OIT) can be found in Chapter 6 of the Hyde *Guardian Ballast Water Treatment System Manual*. This screen can only be accessed at the ballast water treatment plant on the starboard side of the upper platform in the main engine room.
- IAS 400 System Functions – Summary alarms are given on the IAS400 Alarm System. The following indications can be found on the Ballast Systems page:
 - Ballast Water Treatment Unit - General Systems Warning
 - Ballast Water Treatment Unit - General Systems Alarm

11.2.4 Safety and Emergency Procedures

In case of any failure compromising the proper operation of the BWMS, audible and visual alarm signals will be given at all stations from which the ballast water operations are controlled.

Chapter 5.1.3 of the Hyde Guardian BWT System Operating and Maintenance Manual provides specific instructions for operating the BWMS for emergency ballasting or de-ballasting operations of the vessel in case of alarm condition. In case of ALARM condition or VESSEL EMERGENCY, the BWTS can be bypassed. This is accomplished by opening the BWTS Bypass Valve. Opening the BWTS Bypass Valve:

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator:

Gary McGrath

Approved By:

Al Suchy

- Provides a flow path around the filters and UV chamber.
- Closes all other valves when the system is in the Ballasting, De-ballasting or Stripping Modes

11.2.5 Maintenance

The maintenance of the system has been included in the vessel's NS5 planned maintenance system, supplemented by individual maintenance plans for the main components. Procedures of the PMS and the execution of the maintenance plans of the system and the individual main components are detailed in Chapter 7 of the *Hyde Guardian Ballast Water Treatment System, Operating and Maintenance Manual*.

The Ballast Water Management Officer will routinely check the maintenance schedule sheet and the equipment history to verify whether inspection/maintenance has been executed as planned.

11.3 Procedures for Ballast Water Exchange

When ballast water exchange is designated as the primary ballast water management practice for a voyage, the ballast exchange method on R/V Neil Armstrong is to be the sequential method.

The sequential method entails completely emptying the ballast tanks of coastal waters and refilling with open-ocean water. Emptying of certain tanks may lead to significantly reduced stability, higher vessel structural stresses, high sloshing pressures and/or reduced forward drafts which may then increase the probability of bow slamming. At all times during the ballast water exchange sequence, the calculated stability and strength limits defined for the vessel as documented in the vessel's loading manual or trim and stability booklet must be adhered to.

The following preparations will be made prior to the commencement of the exchange:

- Assess the impact of the weather on the exchange operation for the duration of the exchange sequence
- Verify that the departure or initial ballast condition as given in the plan is similar to the actual condition. If the actual initial loading condition does not compare well with the corresponding initial load case provided in the loading manual or trim and stability booklet, the ballast exchange sequence should be re-computed using the onboard loading program to verify conformity with all operating limits
- Verify the vessel is in deep water and in the open ocean - at least 200 nautical miles from shore and 200 meters of water depth
- Verify that there is sufficient time to complete the exchange while in deep water/open ocean. Exchange should only be commenced in any tank if there is sufficient time to complete the exchange.
- After departing port and when in the appropriate open ocean location, proceed with the ballast sequence(s) given in Annex 6 of this Plan. These steps may be used as guidance in performing a ballast exchange sequence.

12 Sediment Management

12.1 General

In addition to the added weight, the carriage of sediments provides a suitable environment for aquatic organisms and pathogens to survive for extended periods of time after the water they were originally in has been discharged. The re-introduction of ballast water may enable the organisms to redevelop and subsequently, upon discharge into another port or area, cause injury or damage to the local aquatic environment. This section provides instructions and procedures for the disposal of sediments both at sea via the use of features incorporated into the vessel's design or while in a port or shipyard to shore-based facilities.

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator:	Approved By:
Gary McGrath	Al Suchy

Regulation B-5 of the *Convention* requires that the vessels should, without compromising safety or operational efficiency, be designed and constructed with a view to:

- Minimize the uptake and undesirable entrapment of sediments,
- Facilitate the removal of sediments, and
- Provide safe access to allow for sediment removal and sampling.

As discussed in 9.4.1, practical steps are to be taken during ballast water uptake to avoid the accumulation of sediments. However, it is recognized that sediments will be taken onboard and will settle on tank surfaces. The amount of sediment accumulation is directly related to:

- The vessel's trading pattern,
- Ballast tank design and configuration,
- The frequency in which the ballast is taken on board,
- The frequency of removal and
- The availability of reception facilities.

As the ballast water treatment system utilizes 55 micron filter banks while ballasting, the accumulation of sediment should be insignificant however, if there are occurrences where the filters are bypassed for a significant period of time the tanks affected shall be inspected prior to returning to normal use. Additionally, ballast tanks requiring periodic survey inspection will be inspected for sediment and cleaned as required. Ballast tanks requiring cleaning will be cleaned in a timely manner and under controlled arrangements in port, at a repair facility or in dry dock or as necessary.

Additionally, fouling organisms should be removed from the hull and piping on a regular basis. Anchors and anchor chains should be rinsed upon retrieval to remove organisms and sediments at their point of origin.

The safety of the crew and the vessel should not be risked by any sediment control and handling practices.

12.2 Disposal of Sediments at Sea

Where sediment has accumulated in ballast tanks and disposal is to be made at sea, consideration should be given to flushing the tank bottoms and other surfaces in suitable locations, such as more than 200 nautical miles from the nearest land in waters having a depth over 200 meters, or in areas designated for ballast water exchange by the port or coastal State.

It is recognized that flushing with sea water or conducting ballast water exchange in open sea may only serve to suspend sediment or remove only a limited amount of the sediment. Therefore, the scheduling of in-tank cleaning of the ballast tanks shall be incorporated in the vessel's NS5 maintenance program schedule. Appropriate entries of the sediment disposal event should be made using the applicable form and kept in the Ballast Water Record Book.

12.3 Disposal of Sediments to Shore

Removal of sediment from ballast tanks should preferably be undertaken under controlled conditions in port, at a repair facility or in dry dock. The removed sediment should preferably be disposed of in a sediment reception facility if this is available, reasonable and practicable. A certificate concerning such disposal should be obtained from the reception facility and appropriate entries shall be made using the applicable form and kept in the Ballast Water Record Book.

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator:	Approved By:
Gary McGrath	Al Suchy

Additionally, tank sediments removed from the vessel under controlled arrangements in port or in dry dock may be disposed of in an approved upland disposal facility in accordance with local and national law.

Under normal circumstances all removal of sediment will be performed as part of the periodic dry dock periods and will be handled by the contracted shipyard. Contracting shipyards shall provide documentation of proper disposal and those records will remain on board in the Ballast Water Record Book.

12.4 Biofouling

Biofouling is the attachment and accumulation of aquatic organisms on a metal surface or structure in contact with water for a period of time. Biofouling takes place in two different forms: micro-fouling and macro-fouling. Micro-fouling occurs when microscopic organisms attach and adhere to the immersed surfaces. These organisms can be bacteria to slimes and algae. Macro-fouling occurs when larger macro organisms attach to the immersed surfaces. Such macro organisms can be barnacles, seaweed, mollusks and any other organisms.

Biofouling control is not required by the Ballast Water Management Convention. It is however generally recognized that biofouling on a vessel can also result in the transfer and establishment of invasive aquatic species that may pose threats to local ecosystems and aquatic environments, similar to ballast water carried by a vessel. While there is currently no requirement for the BWMP to include maintenance procedures addressing biofouling, some Flag Administrations and local coastal states have amended or issued regulations on ballast water management plans incorporating biofouling maintenance and recordkeeping requirements. For example, the amended U.S. Coast Guard regulation on ballast water management which entered into force 21 June 2012 requires the biofouling maintenance and sediment removal procedures be included in the vessel's BWMP under USCG 33 CFR 151.2050(g).

When a vessel-specific Biofouling Management Plan has been prepared in accordance with the guidelines in [MEPC.207 \(62\)](#) (see also [ABS Guidance Notes on Biofouling Management Plan, January 2013](#) and the [Biofouling Management Plan Template](#)) and kept on board, this is considered fulfilling the requirements in USCG 33 CFR 151.2050(g). A reference to this Biofouling Management Plan in the vessel's BWMP is then considered acceptable.

13 Methods of Communication

The quick and effective communication between the vessel and the Port State and local authorities regarding the discharge of ballast water is a significant component in the management of ballast water.

- (a) Ballast water reporting requirements exist for each vessel bound for ports or places in the United States regardless of whether a vessel operated outside of the EEZ.
- (b) The Master, owner, operator, agent or person-in-charge of a vessel to whom this section applies must provide the information required by 33 CFR 151.2045 in electronic or written form to the Commandant, Coast Guard or appropriate COTP as follows:
 - 1) For any vessel bound for the Great Lakes from outside the EEZ
 - i. You must fax the required information at least 24 hours before the vessel arrives in Montreal, Quebec to either the USCG COTP Buffalo, Massena Detachment (315-769-5032), or the St. Lawrence Seaway Development (315-764-3250).
 - 2) For any vessel bound for the Hudson River north of the George Washington Bridge entering from outside the EEZ (which includes the equivalent zone of Canada). You must fax the information to the COTP New York (718-354-4249) at least 24 hours before the vessel enters New York, New York.

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator:	Approved By:
Gary McGrath	Al Suchy

- 3) For any vessel not addressed above, if your voyage is less than 24 hours, you must report before departing your port or place of departure. If your voyage exceeds 24 hours, you must report at least 24 hours, before arrival at your port or place of arrival at your port or place of destination. All required information is to be sent to the National Ballast Information Clearinghouse (NBIC) using only one of the following means:
- Internet at: <http://invasions.si.edu/NBIC/bwform.html>;
 - E-mail to NBIC@BALLASTREPORT.ORG;
 - Fax to 301-261-4319; or
 - Mail to U.S. Coast Guard, c/o SERC (Smithsonian Environmental Research Center), P.O. Box, 28, Edgewater, MD 21037-0028.
- (c) If the information submitted changes, you must submit an amended form before the vessel departs the waters of the United States.

For the purposes of this procedure, the Master is responsible for the submission of this report. The preferred method for submitting the report is via e-mail. The Port Office shall be made an info addressee on that email (portoffice@whoi.edu). If any other submission method is necessary, the Port Office is to be advised of that method in an email sent to that same address.

When entering the State of California, a copy of this form shall also be sent to the State Lands Commission before the vessel departs from the first port of call in California. A copy shall be kept on board in the Ballast Water Log and retained for three years. The address for the California State Lands Commission is as follows:

California State Lands Commission
100 Howe Avenue, Suite 100 South
Sacramento, CA 95825-8202

The Master is responsible for signing the Ballast Water Reporting Form. In his absence, a person in charge of the vessel designated by the Port Office shall sign the form.

13.1 Coastal State with Specific Procedures/Requirements for Discharge of Ballast Water

The actions to be taken by the vessel are:

- Follow the agreed-upon reporting procedure
- Contact the vessel's agent to ascertain the latest information on ballast discharge requirements in the water of the respective state
- Create a timely plan for all the above actions such that safety and operational restrictions are met
- Keep proper records and have them readily available for possible examination

13.2 Coastal State with No Specific Procedures/Requirements for Discharge of Ballast Water

The actions to be taken by the vessel are:

- Contact the vessel's agent and/or company to obtain the latest information on the discharge requirements at the port State territory
- Carry out the discharge of ballast water as per the ballast exchange sequence or by the use of a ballast water treatment system, as applicable

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator:	Approved By:
Gary McGrath	Al Suchy

- Take into consideration safety and operational procedures related to respective discharge
- Keep proper records and have them readily available for possible examination

14 Duties of Designated Ballast Water Management Officer and Vessel's Master

The responsibility for the execution and recordkeeping associated with the management of ballast water is to be assigned to the second officer as the *responsible member of the vessel's crew*. This section of the Plan provides guidance on those duties associated with ballast water management to be performed by the Ballast Water Management Officer and the vessel's Master. Vessel-specific listings of responsibilities are to be carefully identified and included in this section of the Ballast Water Management Plan.

14.1 Duties of Ballast Water Management Officer

Duties of the officer in charge of ballast water management may include:

- i) Follow the applicable Ballast Water Management Plan or develop a new Ballast Water Management Plan on the basis of the vessel's safety criteria, equipment availability and weather forecast
- ii) Proper implementation of the Ballast Water Management Plan including availability of personnel and equipment
- iii) Informing the shore management, the owner or operator of the commencement/interruption/ completion of ballast water management
- iv) Maintaining the Ballast Water Record Book
- v) Verify the required ballast water management recordkeeping records and logs
- vi) Prepare the appropriate national or port Ballast Water Reporting Form prior to the arrival at port
- vii) Assisting the Port State control or quarantine officers with any sampling that may need to be performed
- viii) Providing crew training and familiarization in ballast water management requirements and applicable shipboard systems and procedures
- ix) Other duties specified by the vessel's owners/operators

The Ballast Water Management Officer must periodically keep the vessel's Master advised on the progress of the Plan. If there is any doubt or if the management plan does not keep to the schedule, the Master is to be advised accordingly. Additionally, the appointed Ballast Water Management Officer is to inform the Master when commencing/stopping ballast operations at each stage.

14.2 Vessel's Master

Duties of the vessel's Master include:

- Confirmation that the Ballast Water Management Plan is clearly understood by the appointed Ballast Water Management Officer and by the other responsible officers who may be involved, and that all operations strictly conform to the safety procedures and parameters.
- When ballast water exchange is used, the Master shall consider the *Precautionary Advice to Masters When Undertaking Ballast Water Exchange Operations (MSC/Circ.1145)*. Where transitory deviations of bridge visibility (SOLAS V22), propeller immersion and minimum draft forward during ballast water exchange are acceptable, the Master is to be notified by a note placed in the Ballast Water Management Plan.
- Coordinate communications with coastal and Port State authorities through established procedures. Such communications may include, but may not be limited to, submission of ballast water reporting forms, coordinating inspections of ballast water logs and sampling of ballast water, local restrictions or

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Gary McGrath

Approved By:

Al Suchy

instructions related to the discharge of ballast water, designated areas for discharge of ballast water in the event that the vessel was unable to discharge the ballast water due to weather or mechanical failures.

15 Recording Requirements

15.1 General Requirements

In accordance with Regulation B-2 of the Annex to the Convention, a record is to be kept of each ballast water and sediment management operation. This includes discharges at sea and to the reception facilities. The designated Ballast Water Management Officer is responsible for facilitating the administration of ballast water management and treatment procedures on board the vessel, maintaining appropriate log sheets and records, and verifying that ballast water management and/or treatment procedures are followed, properly recorded and kept up-to-date.

The vessel's ballast water records should be accessible and readily available for examination by port State authorities at all reasonable times, and in case of an unmanned vessel under tow, it may be kept on the towing vessel.

15.2 Ballast Water Record Book

In accordance with Regulation B-2, each ship is to have on board a ship-specific ballast record book that may be an electronic record system, or that may be integrated into another record book or system. Entries in the Ballast Water Record Book shall be made on each of the following occasions:

- a) When ballast water is taken on board:
 - Date, time and location of port or facility of uptake (port or lat./long.) Depth if outside port
 - Estimated volume of uptake in cubic meters
 - Signature of officer in charge of the operation
- b) Whenever ballast water is circulated or treated for ballast water management purpose:
 - Date and time of operation
 - Estimated volume circulated or treated in cubic meters
 - Whether conducted in accordance with the BWMP
 - Signature of the officer in charge of the operation
- c) When ballast water is discharged into the sea:
 - Date, time and location of port or facility of discharge (port or lat./long.)
 - Estimated volume of discharged in cubic meters plus remaining volume in cubic meters
 - Whether approved ballast water management plan had been implemented prior to discharge
 - signature of the officer in charge of the operation
- d) When ballast water is discharged to a reception facility:
 - Date, time and location of uptake
 - Date, time and location of discharge
 - Estimated volume discharged or taken up, in cubic meters

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator:	Approved By:
Gary McGrath	Al Suchy

- Whether approved ballast water management plan had been implemented prior to discharge
 - Signature of the officer in charge of the operation
- e) Accidental or other exceptional uptake or discharge of ballast water:
- Date and time of occurrence
 - Port or position of the ship at the time of occurrence
 - Estimated volume of ballast water uptake or discharged
 - Circumstances of uptake, discharge, escape or loss, the reason therefor and general remarks
 - Whether approved ballast water management plan had been implemented prior to discharge
 - Signature of the officer in charge of the operation

15.3 Record-keeping Forms

15.3.1 Ballast Water Reporting Form

The Ballast Water Reporting Form is to be used when reporting ballast water management to a national or local authority that requests information in advance. When ballast water exchange is used as the ballast water management practice, the *Ballast Water Reporting Form* is to be used based on IMO Assembly Resolution A.868 (20). When a treatment system is used on board for managing the ballast water, the example form given in Annex 4.b is to be used

Communication with the coastal and port States will be made to obtain a copy of any reporting forms and/or instructions which may be unique to that State. Prior to entering into US Waters, the US *Ballast Water Reporting Forms* from the NBIC (National Ballast Information Clearinghouse) via the NBIC website at <http://invasions.si.edu/NBIC/bwform.html> will be obtained. The completed form will be submitted directly to NBIC in accordance with the instructions provided on the website. When this vessel uses its ballast water treatment system accepted under the USCG Alternative Management Systems (AMS) in California waters, a "Ballast Water Treatment Supplemental Reporting Form" will be submitted in addition to the "standard" US Ballast Water Reporting Form.

15.3.2 Ballast Water Handling Records

In compliance with Regulation B-2.5, each operation concerning ballast water shall be fully recorded without delay in the Ballast Water Record Book and each entry shall be signed by the officer in charge of the operation concerned and each completed sheet be signed by the Master. Recordkeeping of the ballast water management activities covering the occasions in 16.2 is accomplished by the use of the following log forms:

- i) A Ballast Water Handling Form outlining the ballast water management activities onboard; and
- ii) A Narrative Record of Unusual Events.

These two forms can be found in Annex 4.c and 4.d. These forms serve as a guide for recording the information concerning the source of the ballast water on board and what ballast water operations have been undertaken during the voyage. It is to be noted that the "narrative record of unusual events" form is also applicable for use in record keeping of activities related to sediment removal during dry dock or by tank flushing at sea.

Even when the vessel is not currently trading in an area where ballast water information is required to be reported, this vessel will have these forms completed, documenting the history of what water has been carried and the ballast water operations undertaken on board.

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator:

Gary McGrath

Approved By:

Al Suchy

When the concerned coastal or Port State has its own ballast water handling form, then those forms will be used. When this vessel intends to enter the waters of the State of California, the required ballast water log will be completed. This is a separate log that outlines the ballast water management activities of each tank onboard a vessel.

16 Crew Training and Familiarization

To assist in the implementation of the Ballast Water Management Plan, the vessel's crew is trained and familiar with the tasks expected of them. The training, together with an understanding as to the reasons why ballast water management is necessary, will promote the effective and efficient operations in accordance with this BWMP.

Training and familiarization of the vessel's crew is essential in the management of ballast water and sediments. Specifically, the training includes instructions on the requirements of the Ballast Water Management Convention, the implementation of the Ballast Water Management Plan, ballast water and sediment management procedures, the recordkeeping requirements of ballast water operations, the Ballast Water Record Book and log forms, and reporting functions. This training is particularly sensitive to those matters concerned with the safety of the vessel and the crew. Records of conducted training are included in Annex 6.

Where a treatment system is installed on board and is used as the main ballast water management practice, the vessel's Master and crew, as appropriate, are to be trained in the operation, handling procedures and maintenance of the installed treatment system, particularly with regard to the operational or safety aspects associated with the treatment system.

The vessel's Master and the crew engaged in the ballast water exchange at sea are trained and familiar with the following as appropriate:

- i. The vessel's ballast pumping and piping arrangements, positions of associated air and sounding pipes, positions of compartment and tank suctions and pipelines connecting them to the vessel's ballast pumps and, when using the flow-through method, the openings used for release of water from the top of the tank, together with overboard discharge arrangements
- ii. The method of confirming that sounding pipes are clear and that air pipes and their non-return devices are in good working order
- iii. The different times required to undertake the various ballast water exchange operations, including the time to complete individual tanks
- iv. The location of and access to sampling points
- v. The method(s) in use for ballast water exchange at sea with particular reference to the required safety precautions
- vi. The need to continually monitor ballast water exchange operations
- vii. The method used onboard for ballast recordkeeping, reporting and recording of routine soundings of the ballast tanks

Provisions for crew training and familiarization include the following:

- Requirements of a general nature regarding ballast water management
- Training and information on ballast water management practices
- Ballast water exchange
- Ballast water treatment systems
- General safety considerations

MANAGEMENT SYSTEM MANUAL

ARM-03 BALLAST WATER MANAGEMENT PLAN

Originator:	Approved By:
Gary McGrath	Al Suchy

- The ballast water record book and maintenance of records
- The operation and maintenance of the installed ballast water treatment systems
- The safety aspects associated with the particular systems and procedures used on board the vessel which affect the safety and health of crew and passengers and/or the safety of the vessel
- Precautions for entering tanks for sediment control
- Procedures for the safe handling and packaging of sediments
- Storage of sediments

The vessel's Master and Ballast Water Management Officer regularly verify that the personnel assigned to key responsibilities in ballast water management practice(s) are suitable and well trained according to the above, special attention being given to the safety aspects related to the subject procedures.

Training records are maintained with this Ballast Water Management Plan.

Vessels operating in the waters of the United States are to maintain onboard a standalone training plan or other documentation, owners/operators must maintain a written training plan describing the training to be provided and a record of the date of training provided to each person trained. (Final VGP 2013/2.2.3.1).

17 Exemptions

17.1 General

Exemptions may be granted to a vessel from Regulations B-3 (with respect to the application of Ballast Water Management for Ships) or C-1 (with respect to Additional Measures) by a party or parties under regulation A-4 of the *Convention* as follows:

- Application for an exemption is to be supported by a risk assessment based on the Guidelines for risk assessment under Regulation A-4 of the BWM Convention (G7), MEPC.162(56)
- Exemptions granted shall be effective only after communication with the IMO and circulation of relevant information to the Parties
- Any exemptions granted to this vessel are recorded here in the BWMP and the vessel's Ballast Water Record Book

18 Supporting Documentation

See ANNEX 5: Table of Supporting Documents

TABLE 1 - Ballast Water Tank Capacity

Tank Number	Location/Frame Number	Capacity Gal (m ³)
Forepeak Ballast Tank (Center)	0-6	10,233 (38.7)
Ballast Tank No. 1 (Center)	6 -16	16,933 (64.0)
DB Ballast Tank No. 2 (P)	16 - 29	7,195 (27.2)
DB Ballast Tank No. 2 (S)	16 - 29	7,195 (27.2)
Ballast Wing Tank No. 3 (P)	77 – 88	11,906 (45.0)
Ballast Wing Tank No. 3 (S)	77 – 88	11,906 (45.0)
DB Ballast Tank No. 4 (P)	88 - 101	14,500 (54.9)
DB Ballast Tank No. 4 (S)	88 - 101	14,447 (54.7)
Ballast Wing Tank No. 5 (P)	101 - 112	4,380 (16.6)
Ballast Wing Tank No. 5 (S)	101 - 112	4,380 (16.6)
Aft Peak Ballast Tank (S)	112 - transom	6,782 (25.7)
Aft Peak Ballast Tank (P)	112 - transom	6,782 (25.7)
Anti-Roll Ballast Tank (C)	39 - 42	7,917 (29.9)
Total Capacity		124,556 (471.5)

TABLE 2 - Ballast Manifold Valve Arrangement

Forward Ballast Manifold:

Tank Valve Designation	Discharge Valve No. (DCI/ Siemens)	Suction Valve No.
Anti-Roll Tank	529-VL-024 / 529-06-09	529-VL-025 / 529-06-10
Ballast No. 2 Port	529-VL-022 / 529-06-06	529-VL-023 / 529-06-05
Forepeak Ballast	529-VL-020 / 529-06-02	529-VL-021 / 529-06-01
Ballast No. 1 Centerline	529-VL-018 / 529-06-04	529-VL-019 / 529-06-03
Ballast No. 2 Starboard	529-VL-016 / 529-06-08	529-VL-017 / 529-06-07

Aft Ballast Manifold:

Tank Valve Designation	Discharge Valve No. (DCI/ Siemens)	Suction Valve No.
Ballast No. 3 Starboard	529-VL-027 / 529-05-04	529-VL-026 / 529-05-03
Ballast No. 4 Starboard	529-VL-029 / 529-05-08	529-VL-028 / 529-05-07
Ballast No. 4 Port	529-VL-031 / 529-05-06	529-VL-030 / 529-05-05
Ballast No. 5 Starboard	529-VL-033 / 529-05-12	529-VL-032 / 529-05-11
Aft Peak Ballast Starboard	529-VL-035 / 529-05-16	529-VL-034 / 529-05-15
Aft Peak ballast Port	529-VL-037 / 529-05-14	529-VL-036 / 529-05-13
Ballast No. 5 Port	529-VL-039 / 529-05-10	529-VL-038 / 529-05-09
Ballast No. 3 Port	529-VL-041 / 529-05-02	529-VL-040 / 529-05-01

Other Valves

The ballast pump can discharge overboard through a solenoid-operated valve controlled at the MCCS and powered from the motor operated valve distribution panel.

Ballast Water Piping and Pumping Arrangement

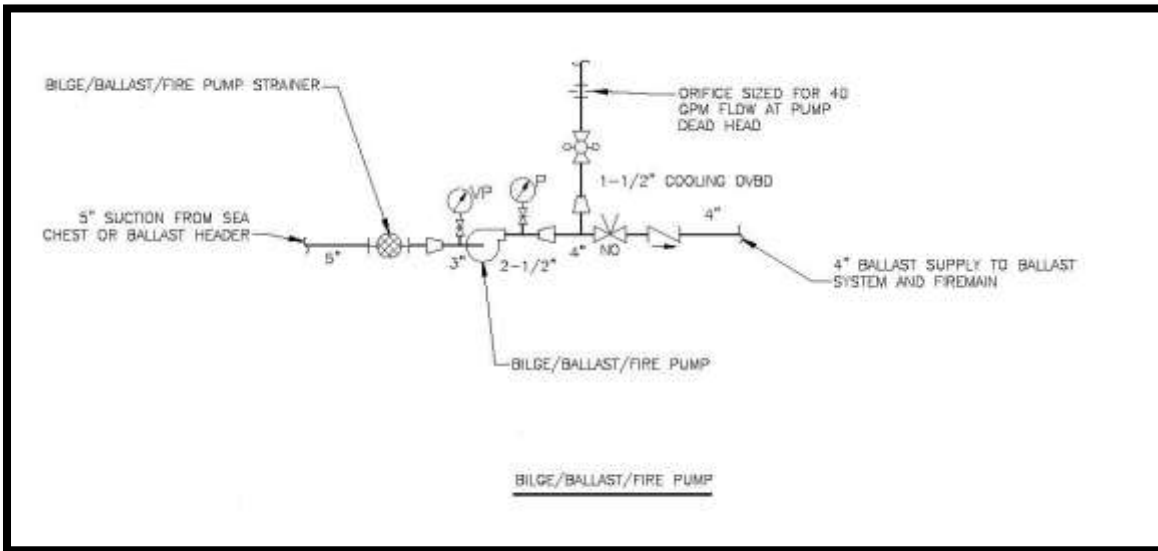

TABLE 3 -Ballast Pump Data

The ballast pump is a self-priming, centrifugal, Ampco Z Series 3 x 2 -10, rated at 360 gpm at 230' TDH, and 3,450 rpm. A 40 HP motor drives the pump. The ballast pump motor is powered from the switchboard (P432).

Pump Name	Rated Capacity Gals/min (m3/hour)	Type	Location
Bilge Ballast Fire Pump	360 (98.2)	self-priming, centrifugal, Ampco Z Series 3 x 2 -10	Lower main machinery room (LMMR)

Guidance for Completing the Ballast Water Reporting Form

<p>Please fill out in English and make every effort to PRINT clearly</p> <p>Section 1: Vessel information</p> <p>Vessel name: Print the name of the vessel.</p> <p>Owner: The registered owner(s) or operator(s) of the vessel.</p> <p>Flag: Country under which the ship normally operates. Write the full name Do not use abbreviations.</p> <p>Last port and country: Last port and country at which the vessel called before arrival in the current port. Write the country and port names in full. Do not use abbreviations.</p> <p>Next port and country: Next port and country at which the vessel will call, upon departure from the current port. Write the country and port names in full. Do not use abbreviations.</p> <p>Type: List specific vessel type, write out or use the following abbreviations: bulk (bc); ro-ro (rr); container (cs); tanker (ts); passenger (pa); oil/bulk ore (ob); general cargo (gc). Write in any additional vessel types.</p> <p>GT: Gross tonnage.</p> <p>Arrival date: Arrival date to current port. Use European date format (DDMMYY).</p> <p>IMO number: Identification number of the vessel used by the International Maritime Organization.</p> <p>Call sign: Official call sign.</p> <p>Agent: Agent used for this voyage.</p> <p>Arrival port: This is the current port. Write the name in full. Do not use an abbreviation.</p> <p>Section 2: Ballast water <i>(Note: Segregated ballast water = clean, non-oily ballast)</i></p> <p>Total ballast water onboard: Total segregated ballast water upon arrival to current port, with units.</p> <p>Total ballast water capacity: Total volume of all ballast tanks or holds, with units.</p> <p>Section 3: Ballast water tanks</p> <p>Count all tanks and holds separately (e.g., port and starboard tanks should be counted separately).</p> <p>Total no. of tanks onboard: Count all tanks and holds that can carry segregated ballast water.</p>	<p>Ballast water management plan: Do you have a ballast water management plan specific to your vessel onboard? Check Yes or No.</p> <p>Use of Management plan: Do you follow the above management plan? Check Yes or No.</p> <p>No. of tanks in ballast: Number of segregated ballast water tanks and holds with ballast at the onset of the voyage to the current port. If you have no ballast water onboard, go to section 5.</p> <p>No. of tanks exchanged: This refers only to tanks and holds with ballast at the onset of the voyage to the current port.</p> <p>No. of tanks not exchanged: This refers only to tanks and holds with ballast at the onset of the voyage to the current port.</p> <p>Section 4: Ballast water history</p> <p>Ballast water source: List all tanks and holds that you have discharged or plan to discharge in this port (carefully write out, or use codes listed below the table). Follow each tank across the page listing all source(s), exchange events, and/or discharge events separately. If the ballast water history is identical (i.e., the same source, exchange and discharge dates and locations), like tanks can be combined (example: wing tank 1 with wing tank 2 both water from Belgium, exchanged Oct. 3rd, mid ocean – can be combined. See first line of the table in the sample form). Use an additional page if necessary. Include ship name, date and IMO number at the top of each page.</p> <p>Date/Time: Date and time of ballast water uptake. Use European format (DDMMYY) and (HHMMSS).</p> <p>Port or latitude/longitude: Location of ballast water uptake. If carried out in port, write the port name in full.</p> <p>Volume: Volume of ballast water uptake, with units.</p> <p>Temperature: Water temperature at time of ballast water uptake, in degrees Centigrade (Celsius).</p> <p>Ballast water exchange: Indicate exchange method: Circle empty/refill or flow through.</p> <p>Date/Time: Date and time of ballast water exchange. Use European format (DDMMYY) and (HHMMSS).</p>	<p>Endpoint or latitude/longitude: Location of ballast water exchange. If it occurred over an extended distance, list the end point latitude and longitude.</p> <p>Volume: Volume of ballast water exchanged, with units.</p> <p>Percentage exchanged: Percentage of ballast water exchanged. Calculate this by dividing the number of units of water exchanged by the original volume of ballast water in the tank. If necessary, estimate based on pump rate. (Note: For effective flow-through exchange this value should be at least 300%).</p> <p>Sea height (m): Document the sea height in meters at the time of the ballast exchange (Note: this is the combined height of the wind seas and swell, measured from crest to trough).</p> <p>Ballast water discharge:</p> <p>Date/Time: Date and time of ballast water discharge. Use European format (DDMMYY) and (HHMMSS).</p> <p>Port or latitude/longitude: Location of ballast water discharge. If discharged in a port, write the name of the port in full.</p> <p>Volume: Volume of ballast water discharged, with units.</p> <p>Salinity: Document salinity of ballast water at the time of discharge, with units, [i.e., specific gravity (sg) or parts per thousand (ppt)].</p> <p>If exchanges were not conducted, state other control action (s) taken: If exchanges were not made on all tanks and holds to be discharged, what other actions were taken? (i.e., transfer of water to a land-based holding facility or other approved treatment).</p> <p>If none, state reason why not: List specific reasons why ballast exchange was not done. This applies to all tanks and holds being discharged.</p> <p>Section 5: IMO Ballast water</p> <p>IMO Ballast Water Convention and IMO Guidelines onboard. Is a copy of the IMO Convention and Guidelines on board? Check Yes or No.</p> <p>Responsible officer's name and title (printed) and signature: e.g., Master, chief officer or chief engineer must PRINT their name and title and sign the form.</p>
